

Verifeyed API Security Overview

Verifeyed makes security and privacy a priority following industry best practices to protect your data. Verifeyed API is hosted on Amazon Web Services (AWS).

Clear data location

All customer data is currently processed on servers at AWS data centers. No data is stored outside of AWS. We use data centers in Europe, USA, China, and Singapore to meet requirements of customers from those regions. Customers are able to decide where they wish to store their data.

We don't store or access your data

Verifeyed is not a storage service; it's for image verification only. An automated procedure will remove the images within 48 hours.

In accordance with our procedures, Verifeyed employees are not permitted to review client images and recognition results, even within these 48 hours, except in exceptional circumstances where an image:

- causes the service failure
- leads to the abnormal consumption of computing resources,
- leads to additional exceptional cases connected with the functionality of the service
- customer requests in-depth analysis of the image

A limited number of authorized Verifeyed personnel may review this image for the sole purpose of reproducing and fixing the issue this image has caused.
